

## New website highlights potential of Optical Wireless Communication

**Online PR News - Merritt Island, FL – 30-September-2020:** 30 September, X-lumin Corp., provider of turn-key systems for ground-to-space laser communication; land-based optical wireless communication, and space situational awareness with advanced integration capabilities, launched a new website. The new site offers more details and insight into X-lumin's products and engineering and design services.

X-lumin's aim is to bring telecommunications reliability and costs to optical wireless communications systems. Their "whole system solutions" come with one of the most versatile and comprehensive software platforms for managing Precision Optical Pointing and Tracking (OP&T) applications available in the market today. But ease of use and integration is what makes these solutions most attractive - placing control directly in the hands of the user to easily manage multiple applications and control all elements in the network through a single user interface and access point.

The newly launched website features product descriptions and downloadable product sheets as well as details on the company's consulting and design services. X-lumin's products are standard, yet customizable and take advantage of widely available, high-quality telecommunications components while embracing modular design and upgrade capability. Their unique approach to optical turbulence mitigation and laser safety -- lowering risk and increasing performance of client designs -- is now available to clients through a number of consulting and design services.

X-lumin is driven to push the boundaries of emerging technology in the optical wireless communication space. Their desire to reduce costs and build an effective and efficient bridge between existing communications technology and the need for a high-speed data highway to meet exploding IoT demands, makes them well-positioned to respond to a rapidly changing marketplace.
